ABSTRACT OF THE DISCLOSURE

There is disclosed a video apparatus, comprising: a serial receiver for receiving, reproducing and outputting a serially transmitted synchronous clock, a control signal, and a signal containing video data; and a phase locked loop (PLL) for generating a differential clock having a phase different from that of the signal input from the serial receiver, and a main clock having a phase different from that of the signal input from the serial receiver, and a frequency twice as much as that of the differential clock, based on the signal input from the serial receiver. possible to set optimal timing for a clock signal and a video data signal to the component of the latter part of the serial receiver. Moreover, it is possible to supply a clock signal having no drifting caused by a temperature change to the component of the latter part of the serial receiver.
